Before to install the vanilla server and tools in your post, you have to:

- Ensure that a JDK is installed in your post. The minimal version of the JDK to run all the vanilla's tools is 1.5.14.
- If you don't use the Derby version, create a user biplatform/biplatform on your databases servers. This user must have the rights (SELECT, UPDATE, INSERT) on the databases: vanilla, repository, sampledata.
